

Using ninfs on macOS

The standalone Mac application requires macOS 10.12.6 or later.

Macs with Apple Silicon are not tested and currently not supported with the standalone build, which is built for Intel. You may need to install Python and run ninfs separately.

macFUSE is required. You can download the latest version at <https://osxfuse.github.io>.

Gatekeeper

The application is currently not signed. Gatekeeper may prevent you from opening it. To run the application, control-click the ninfs app, then click Open. You might need to do this more than once to get the option to open.
